

Genotype Reconstruction for Diversity Outbred Mice

A comparison of $r/qt12$ and DOQTL

Data

Two *large* 3D arrays of emission probabilities

- ▶ `r\qt12` (Broman)
- ▶ `DOQTL` (Gatti)

Data

Two *large* 3D arrays of emission probabilities

- ▶ $r \backslash qt12$ (Broman)
- ▶ DOQTL (Gatti)

$500 \times 120,000 \times 36$ (Individual \times Markers \times Haplotype)

Data

Two *large* 3D arrays of emission probabilities

- ▶ $r \backslash qt12$ (Broman)
- ▶ DOQTL (Gatti)

$500 \times 120,000 \times 36$ (Individual \times Markers \times Haplotype)

How are they different (or the same)?

Inferred Haplotypes

INSERT INFERRED HAPLOTYPE IMAGE (BARS)

Measure of distance

Measure of distance

For each individual at each marker:

Compute *sum of absolute differences*

$$\sum_{i=1}^{36} |p_{1,i} - p_{2,i}|$$

Measure of distance

For each individual at each marker:

Compute *sum of absolute differences*

$$\sum_{i=1}^{36} |p_{1,i} - p_{2,i}|$$

Reduces problems to two-dimensions:

Measure of distance

For each individual at each marker:

Compute *sum of absolute differences*

$$\sum_{i=1}^{36} |p_{1,i} - p_{2,i}|$$

Reduces problems to two-dimensions: $500 \times 120,000$

Measure of distance

For each individual at each marker:

Compute *sum of absolute differences*

$$\sum_{i=1}^{36} |p_{1,i} - p_{2,i}|$$

Reduces problems to two-dimensions: $500 \times 120,000$

Each entry represents distance between methods
